## Sharing Lessons Learned from Fatality (Not HCC, Intel or in Israel)

- Two workers were using 2 scissor lifts to raise a 7 meter long wooden beam. They placed the MEWPs 3 meters apart, put the beam on the top of the rails.
- The worker climbed the side of his lift and fell onto his back, the 189 kg beam then fell on top of the worker. The worker was pronounced dead at the scene from severe head injuries.

## Sharing Lessons Learned from Fatality (Not HCC, Intel or in Israel)

- Investigators found:
- The worker was not trained to use the lift and the coworker had limited knowledge of the hazards of placing and elevating materials on the MEWP guardrails.
- The employer knew that the manufacturer does not permit lifting materials on the top of the guardrail, but claimed to be unaware of other options.
- Workers on the site could not read the risk assessment, manufacturer manual, or the MEWP checklist- as it was only in English and they only spoke Spanish.
